Slope Stabilisation

With a wide range of experience, expertise and foundation techniques at its disposal, Cementation Skanska is able to offer a solution to nearly all slope stabilisation problems.

The term "slope stabilisation" is relevant to the stabilisation of both existing slopes and new excavations, in either natural or man-made ground conditions.

Examples of situations requiring stabilisation include:

- infrastructure embankments and cuttings
- excavations
- existing retaining walls
- tunnel portals
- natural slopes
- cliff faces.

The range of techniques that can be applied is as necessarily diverse as the range of problems and includes ground anchors, soil nails, minipiles, bored piles, lime stabilisation, drainage, earthworks and vegetation.
